

Outline

- What is Episodic Memory
- Measuring Episodic Memory
- Principles of Episodic Encoding
 - Attention
 - Depth of Processing (aka Levels of Processing)
 - Retrieval Practice and Encoding
 - Repetition and Spacing

Depth of Processing

(Craik & Lockhart, 1972; Craik & Tulving, 1975)

Stimuli / Events can be processed at different “levels”

Depth of Processing

(Craik & Lockhart, 1972; Craik & Tulving, 1975)

Stimuli / Events can be processed at different “levels”

Shallow (sensory aspects)

perceptual: process perceptual features of the stimulus

phonological: process stimulus via speech codes

semantic: process the meaning of the stimulus

Deep (conceptual aspects)

Depth of Processing

(Craik & Lockhart, 1972; Craik & Tulving, 1975)

Stimuli / Events can be processed at different “levels”

Shallow (sensory aspects)

perceptual: process perceptual features of the stimulus

phonological: process stimulus via speech codes

semantic: process the meaning of the stimulus

Deep (conceptual aspects)

Encoding = incidental byproduct of active stimulus processing

Depth of Processing

(Craik & Lockhart, 1972; Craik & Tulving, 1975)

Stimuli / Events can be processed at different “levels”

Shallow (sensory aspects)

perceptual: process perceptual features of the stimulus

phonological: process stimulus via speech codes

semantic: process the meaning of the stimulus

Deep (conceptual aspects)

- “Deeper” processing = more effective encoding
- Challenges the “Modal Model” (time in WM=>LTM)

Encoding = incidental byproduct of active stimulus processing

DoP Effect: Hyde & Jenkins (1968)

Subjects performed one of four tasks with a list of 24 words

- 1) Intentionally commit words to memory

D – 2) Judge pleasantness of words

- 3) Judge whether there is an “e” in the word

S

- 4) Judge how many letters are in the word

DoP Effect: Hyde & Jenkins (1968)

Subjects performed one of four tasks with a list of 24 words

- 1) Intentionally commit words to memory

D – 2) Judge pleasantness of words

- 3) Judge whether there is an “e” in the word

S

- 4) Judge how many letters are in the word

- Memory was better after Deep vs. Shallow encoding
- Intentional encoding no better than incidental deep encoding

∴ critical factor is the type of processes engaged (i.e., the type of features attended) during encoding, irrespective of why

Difficulties for Depth-of-Processing

Circular Logic: No independent measure of “depth” other than subsequent memory performance

Transfer Appropriate Processing

Is deep encoding always better?

- Alternative hypothesis: Efficacy of encoding strategy partly depends on what information is needed at test (i.e., depends on what you want to remember)

Transfer appropriate processing

Past processing influences subsequent memory to the extent that the processes engaged at retrieval are similar to those engaged at encoding
(Morris, Bransford, & Franks, 1977)

Operations at encoding and at retrieval can vary from perceptually–driven to conceptually–driven. Test performance will be optimal when the two match.

TAP: Morris et al. (1977) study

Subjects performed one of two study tasks

- In each case, they had to say whether a target word fit into the blank
- Meaning condition
 - The _____ was on the shelf
 - “book” - yes or no
- Phonology (rhyme) condition
 - _____ rhymes with fear
 - “spear” - yes or no

Memory was measured using two different types of test

- Recognition test (“Did you see ‘book’ before?”)
- Rhyme cued-recall (“Did you see a word that rhymes with ‘clear’ before?”)

TAP: Morris et al. (1977) results

- Recognition performance was better following meaning task
- Rhyme cued-recall performance was better following rhyming task
- Deep study is not always better

Implications from Depth of Processing

- Levels of processing differ with respect to:
 - Which features of an item/event are encoded
 - The degree to which new information is related to prior knowledge
- Semantic (deep) processing may be more distinctive, leading to less interference across items
- Semantic processing links new information to existing knowledge, providing more retrieval cues at test

Outline

 - Attention
 - Depth of Processing
 - Retrieval Practice and Encoding
 - Repetition and Spacing

Other Factors that Optimize Memory

Factors that maximize memory retention over shorter delays often result in poor long-term retention

- Can lead to overestimation of learning
- Optimal learning requires “desirable difficulties”

What maximizes long-term retention?

- Retrieval as a way to learn
 - Tests are the best way to learn and retain information
- Spaced practice

The Generation Effect

READ Conditions:

Synonym	Unhappy – SAD
Rhyme	Lad – SAD

GENERATE Conditions:

Synonym	Unhappy – S____?
Rhyme	Lad – S__?

Depth of Processing

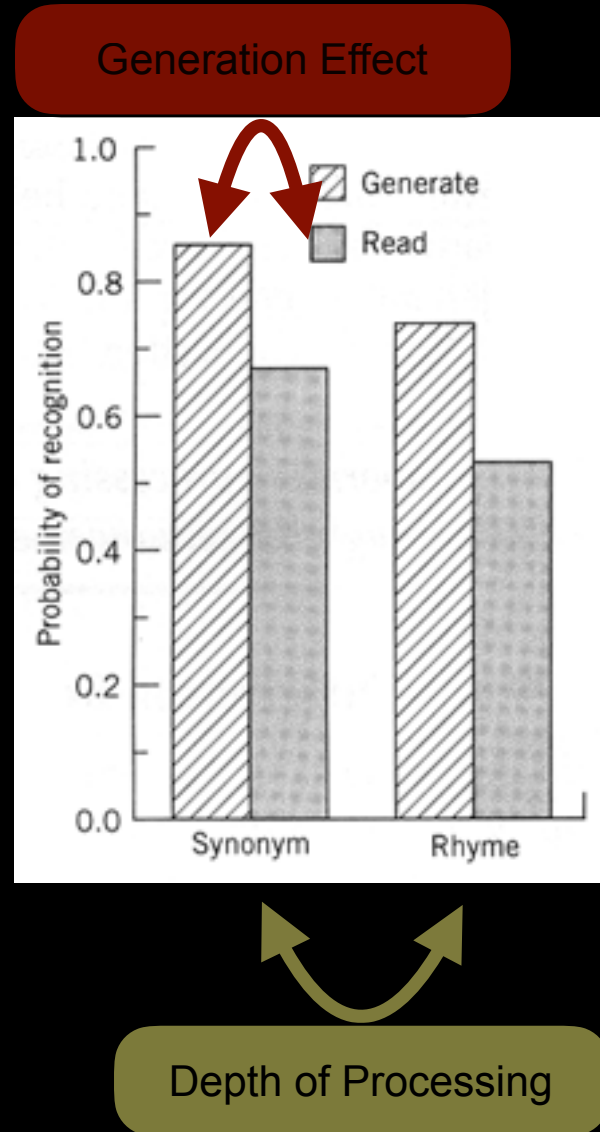

The Generation Effect

READ Conditions:

Synonym Unhappy – SAD
Rhyme Lad – SAD

GENERATE Conditions:

Synonym Unhappy – S____?
Rhyme Lad – S____?

The Generation Effect

READ Conditions:

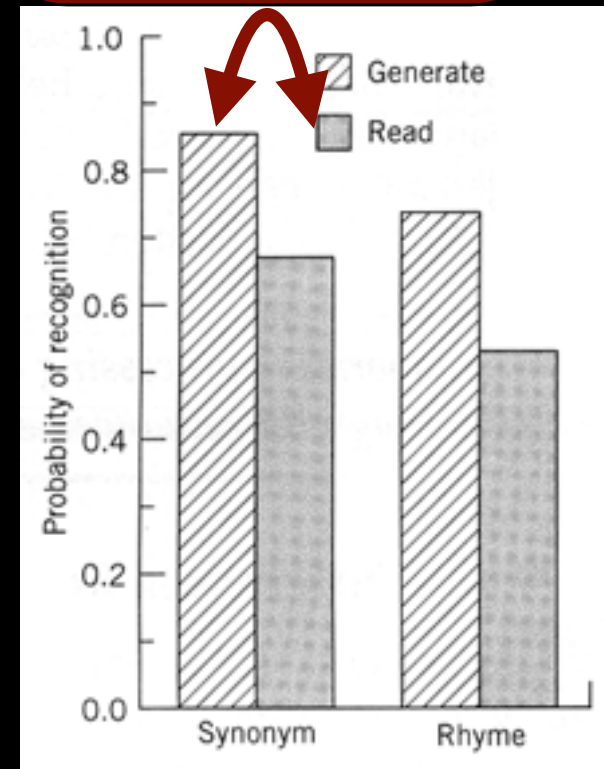

Synonym	Unhappy – SAD
Rhyme	Lad – SAD

GENERATE Conditions:

Synonym	Unhappy – S____?
Rhyme	Lad – S__?

Generation Effect

You are more likely to remember material if you generate it yourself, rather than simply being exposed to it

Depth of Processing

Power of Retrieval as an Encoding Event: Roediger & Karpicke (2006)

Subjects were given a text passage to learn

Three learning conditions

- SSSS: four study presentations (i.e., four times reading the passage)
- SSST: three study presentations followed by one test
- STTT: one study presentation followed by three tests

Power of Retrieval as an Encoding Event: Roediger & Karpicke (2006)

Subjects were given a text passage to learn

Three learning conditions

- SSSS: four study presentations (i.e., four times reading the passage)
- SSST: three study presentations followed by one test
- STTT: one study presentation followed by three tests

Critical measures

- Immediately asked how well they felt they had learned the material (*Judgment of Learning; JOL*)
- 5 min or 1 week later, then tested on how well they retained the ideas from the passage

Judgments of Learning (JOL)

Subjects in SSSS felt that they had learned the material better than the other groups

Memory Performance

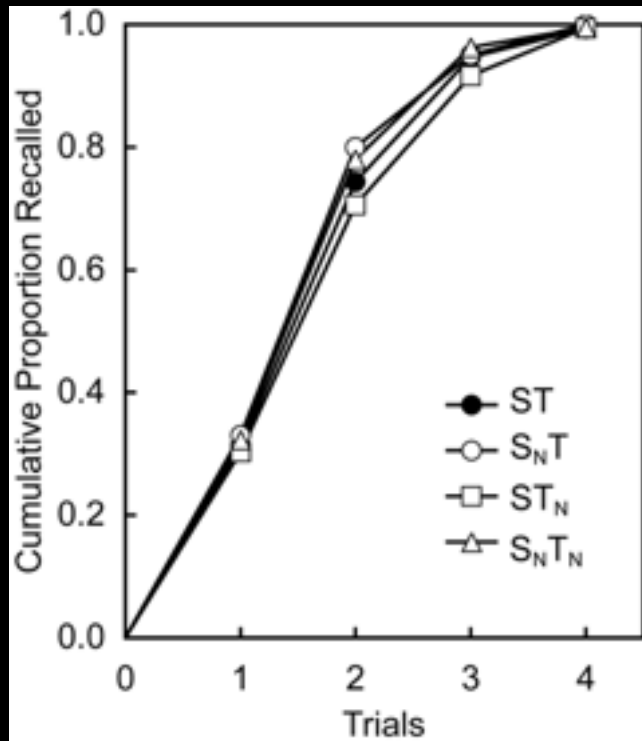

Testing promotes better long-term retention than repeated studying

Roediger & Karpicke (2008)

- Participants learned Swahili-English translations (e.g., mashua – boat) over repeated study-test cycles
- Assigned to one of four strategies:
 - Present all items for each study/test cycle (ST)
 - Present non-recalled items during study, but test all items ($S_N T$)
 - Present all items during study, but test non-recalled items (ST_N)
 - Present and test non-recalled items ($S_N T_N$)
- Recall tested one week later

Roediger & Karpicke (2008)

During learning cycles

Roediger & Karpicke (2008)

During learning cycles

Test after 1-week delay

- Studying information you “already know” without testing is ineffective ($ST > ST_N$)
- Being tested once isn’t as effective as repeated testing ($S_N T > S_N T_N$)

Outline

- What is Episodic Memory
- Measuring Episodic Memory
- Principles of Episodic Encoding
 - Attention
 - Depth of Processing
 - Retrieval Practice and Encoding
 - Repetition and Spacing

Ebbinghaus on Repetition

- Found that repeatedly studying stimuli reduced forgetting
 - The more repetitions, the better his memory performance

Distribution of Practice

Not all encoding events are created equal

“with any considerable number of repetitions a suitable distribution of them over a space of time is decidedly more advantageous than the massing of them at a single time” – Ebbinghaus (1885)

Spaced Practice (Spacing Effect)

- greater lags between practice/study trials yield better long-term retention

The Spacing Effect

Jacoby (1978) Procedure

Study Phase

Once-Presented Pairs

Foot Shoe (*Read*)

OR

Foot S - - e (*Generate*)

Jacoby (1978)

Jacoby (1978)

Understanding the Spacing Effect

Deficient processing: during massed practice, repeated occurrences of an item are not processed fully

- less attention to items just processed

Encoding variability: longer lags result in more variable encoding

- variable encoding: e.g., different encoding contexts; different ways of elaborating on or thinking about the material
- variability may derive from **context fluctuations across time** (Estes' stimulus sampling theory; see Fig 1.8)
- variable encoding improves retrieval because one has **more cues** to use when trying to remember

Study2

Test

- Episodic memory is *associative*
 - binding of items to context
- Episodic retrieval is *cue dependent*
 - probability of remembering partly depends on the cues used to probe memory
- *Context* plays a powerful role in episodic memory

Chien

$P(\text{recall}) = .75$

Summary: Optimal Learning Strategies

- Attend to the information
 - minimize distractions
- Attend to the attributes of the information that you expect you will need to remember in the future
 - typically the meaning of events
 - relate new information to other things you know
- Practice retrieving the information from memory
- Distribute your study episodes/retrieval practices across time

Midterm 1 Summary

MEDIAN = 87.9

MEAN = 86.1
